VooPoo’s Latest Pod Kits: Argus G4 vs Argus G4 Mini

We aren’t joking when we say that at Tidal Vape, we are always on our feet scanning what is new, what is worth stocking, and what will genuinely hold up in everyday use. The VooPoo Argus G4 and the Argus G4 Mini are two of the most exciting kit launches we have had through the doors recently, and both are now available online and in store.

They share the same Argus DNA and the same headline battery, but they are built for slightly different people. This post breaks both down properly so you can figure out which one is the better fit for you.

A Quick Look at Both Kits

Before getting into the detail, here is where each one sits at a glance:

	Argus G4	Argus G4 Mini
Price	£25.99	£14.99
Battery	1650mAh	1650mAh
Max Output	35W	30W
Screen	0.85" TFT	None
Pod Capacity	2ml	2ml
Charging	USB-C 5V/2A	USB-C 5V/1A
Pods in Box	2	1
Weight	66g	56g
Materials	Aluminium Alloy, Zinc Alloy, Leather	Aluminium Alloy

Both are TPD-compliant and come with the new ARGUS Multi-Ohm Cartridge platform, which is the headline feature across the whole G4 range.

The ARGUS Multi-Ohm Cartridge: The Bit That Actually Matters

VooPoo have introduced something genuinely new with this release. Instead of selling you separate pods for different vaping styles, both the G4 and G4 Mini use a single cartridge that supports multiple resistances.

On the Argus G4:

- Three resistance options: 0.4Ω, 0.7Ω, and 1.0Ω
- 0.4Ω suits a more direct-to-lung, airier draw
- 0.7Ω sits in the middle, good for a relaxed restricted draw
- 1.0Ω is tight and mouth-to-lung, ideal for nic salts

On the Argus G4 Mini:

- Two resistance options: 0.7Ω and 1.0Ω
- Switch between them by flipping the pod 180 degrees
- The device detects the resistance automatically

This is a practical upgrade. You are not carrying two pods around or swapping coils. You pick your style, set the pod accordingly, and go. Both cartridges use VooPoo's Multi-Core Electrode Technology, which distributes heat more evenly across the coil for better flavour consistency over the life of the pod.

Both kits also feature Liquid-Seal Shield technology, a design detail that keeps liquid from creeping into the pod connection area. After 30 days of testing by VooPoo, the result is noticeably cleaner connections and less gunky residue to deal with during regular use.

The VooPoo Argus G4: The Full Package

The G4 is the flagship of the two. At £25.99, it is positioned as a proper everyday kit with a bit more control and versatility built in.

Key features:

- 1650mAh battery with USB-C 5V/2A fast charging (full charge in around 55 minutes)
- Output range of 5W to 35W, adjustable via the screen
- Gene AI 3.0 chipset with Smart Mode, which auto-adjusts wattage to match your pod
- 0.85" TFT colour screen showing wattage, battery level, resistance, and puff count
- Resistance range of 0.4Ω to 3.0Ω, so it works with a wide range of ARGUS pods
- Eight built-in safety protections
- Available in Aluminium Alloy and Zinc Alloy variants (Zinc Alloy adds a leather finish on some colourways)
- Comes with two 2ml Multi-Ohm Cartridges, a lanyard, USB-C cable, user manual, and ARGUS Pod Family Compatibility Guide

Available colours: Black, Blue, Brown, Green, Grey, Orange, Purple, Silver

The screen is a detail worth calling out. It keeps the experience intuitive without turning the device into something complicated. You can see exactly what is going on at a glance, adjust wattage up or down with the fire button, and the Smart Mode takes care of the rest if you just want to vape without fiddling with settings.

The Zinc Alloy version is heavier at 85g, but the leather finish colourways look noticeably more premium. The Aluminium Alloy version sits at 65g and is the slimmer of the two builds.

The VooPoo Argus G4 Mini: Compact, Clean, and Very Capable

The Mini comes in at £14.99 and is aimed at vapers who want simplicity, portability, and solid battery life without the screen and the extra features.

Key features:

- Same 1650mAh battery as the full G4
- Output up to 30W
- No screen, inhale-activated with a single button
- Stepless airflow control via a rotating ring at the base
- Multi-Core Electrode Technology and Liquid-Seal Shield
- USB-C charging at 5V/1A (slightly slower than the G4)
- Weighs just 56g, aluminium alloy construction throughout
- Comes with one 2ml Multi-Ohm Cartridge and a USB-C cable

Available colours: Black, Blue, Cyan, Green, Orange, Purple, Titanium, White

The Mini is genuinely small. It has a different colour range to the G4, including Cyan and Titanium which are not available on the larger model. The stepless airflow is one of the better implementation details here. Instead of clicking between preset airflow positions, you just rotate the ring to wherever feels right.

The main concessions compared to the G4 are the slower 1A charging, the lower 30W ceiling, only one pod in the box rather than two, and no lanyard. For most vapers, especially those coming off disposables or looking for an unfussy daily device, none of those things will matter much.

How they compare side by side

Here is where the two kits actually differ in practical use:

Battery and Charging Both packing a 1650mAh cell is the standout shared spec. That is a lot of battery for a pod kit of either size. The G4 charges faster thanks to 2A input versus the Mini's 1A, so if you tend to top up at your desk during the day, the G4 gets you back to full quicker. The Mini will still charge fine; it just takes longer.

Vaping Style

- The G4 covers the full range from tight MTL at 1.0Ω all the way to sub-ohm at 0.4Ω, with wattage control via the screen to fine-tune the experience
- The Mini handles MTL and a light restricted DTL with its 0.7Ω and 1.0Ω options, dialled in purely through the airflow ring
- If you vape nic salts and want a tight draw, both work. If you want the option to go more open and airy, the G4 gives you more range.

Build and Feel

- The G4 feels more substantial, particularly in the Zinc Alloy variant
- The Mini is noticeably lighter and more pocket-friendly
- Both have solid build quality for the price point

Screen vs No Screen This is mostly a preference call. The Argus G4's TFT display is handy for keeping track of battery level and wattage without guessing. The Mini strips that out completely, which some vapers actually prefer. Fewer things to look at, fewer things to go wrong.

Price Difference £11 separates them. The G4 includes an extra pod (worth noting given pod prices), a lanyard, faster charging, and a screen. The Mini at £14.99 is genuinely good value for what you get.

Which one should you go for?

The Argus G4 makes sense if you:

- Want to be able to switch between tighter and more open vaping styles
- Like having a screen with real information on it
- Prefer faster charging
- Want the option of a Zinc Alloy build or leather finish colourway
- Are happy spending a bit more for more features

The Argus G4 Mini makes sense if you:

- Want a compact, lightweight daily carry
- Prefer a simpler device without a screen
- Vape nic salts and mostly want an MTL or light restricted DTL draw
- Are coming from disposables and want something more sustainable and cost-effective
- Want a capable pod kit at under £15

What do we think and opine?

Both the Argus G4 and the Argus G4 Mini are strong additions to the Tidal Vape lineup. The shared Multi-Ohm Cartridge platform and the 1650mAh battery across both devices show that VooPoo has put genuine thought into the G4 range rather than just releasing spec sheet upgrades.

The G4 is the more complete kit for vapers who want versatility and control. The Mini is the one for people who want something light, simple, and affordable that still delivers on battery life and flavour.

Both come with two free e-liquids when you order from Tidal Vape, with a full selection of nic salts from brands like Vortex Bar Series, Elfliq, Bar Juice 5000, and more to choose from.
